Building a Cloud

Scope of the Project

- Pretend to be a sysadmin with no prior OpenStack knowledge
- Try to rely only on install docs and google searches
- $1500 USD Budget
- Build a basic compute cloud:
  - Keystone
  - Glance
  - Nova
  - Neutron
- Install from Ocata from tarballs
- No automation or pre-existing install scripts

Buying Hardware

- Maximize core count per USD
- Second priority is amount RAM
- Machines don't need to be fast (that costs money)

The Servers

Model	PowerEdge R610
Processor	2x Intel Xeon E5540
Memory Installed	32GB Total Memory; 8 x 4 GB DDR3
Hard Drives	2x 146GB 10K SAS Hard Drive
RAID Controller	Dell PowerEdge R610 Perc 6i
Ethernet	2x Dual Port Embedded Broadcom NetXtreme ll 5709c
Return Policy/Warranty	60 days Money Back Or Exchange

$215 Each

Quirks with the servers

- Super stripped down:
  - No management interface
  - No redundant power supply
- Memory installed in wrong slots
- Came pre-installed with Windows Server 2012 (and default password Apple123)
- At full fan speed >**70 dB**

Assembling the Cloud

- Need something to hold the servers
- Traditional racks are too much money (even used)
LackRack

Installing the Operating System

- Installed Ubuntu 16.04 LTS server
- Nothing special, stick with base packages

Installing OpenStack

1. Download service tarball
2.

Setting Up Keystone

- 2 config options
- Needed a service user

```

```
Setting up Nova

- Needed

NOVA

an OpenStack Community Project

Setting Up Neutron

- Needed

Installation Pain Points

- Python Packaging:
  - Binary Dependencies
  - etc files (and any data files)
  - No dependency solver, use upper constraints
- Debugging OpenStack requires a high level of competence

What to do with your budget cloud?

OpenStack Development

- Lots of capacity for running devstack
- A really good platform to develop and test OpenStack applications

- https://github.com/mtreinish/handbrakecloud

- 5x 1U Servers in your bedroom closet is not pleasant
- The power bill
-

Where to get more information
